

Graphite Electrodes

Quality • Service • Reliability

Working with Customers to Attain Maximum UHP Electrode Value

SDKC is focused on providing customers with the best UHP electrode value in the market. To do so, we concentrate the resources of our marketing/sales, technical and field service groups to achieve desired results. Each is a vital link in delivering maximum product value to our customers.

For example, an important aspect of SDKC marketing and sales is to accurately determine present and future needs of the manufacturers and users of electric furnaces. This information sets the guideline for the direction of our planning, product development and investment. It assures that we are truly responding to industry and customer requirements.

Our technical group integrates product characteristic needs from customers into product development and manufacturing. This enables us to tailor our product to keep stride with fast-paced technological changes in the EAF industry. SPC/DARTS technology and our specialization in large diameter electrodes makes SDKC uniquely capable.

No where is product value assurance more clearly displayed than in the role of SDKC field service. The group assists customer electric furnace operations personnel in obtaining more efficient and low cost use of electrodes as well as associated systems. Through consistent electrode performance, both the operator and SDKC technical service engineer can isolate and eliminate significant and expensive process variables.

We offer the best in UHP electrode technology, production and service to keep you competitive in electric steelmaking.
